SUMMARY

Computer Science undergraduate with hands-on experience in machine learning, data science, Python, and full-stack application development. Built projects involving demand forecasting, deep learning, blockchain, and data analytics using Python, PyTorch, React, SQL, and Tableau. Experienced in AI-assisted software development and rapid prototyping. Seeking Software Engineer, Machine Learning Engineer, or Data Science internship opportunities.

EDUCATION

B.E. Computer Science & Engineering — Karpagam Academy Of Higher Education, 2023 – 2027

Semester Exchange — INTI International University, Malaysia

Aug – Dec 2025

Took courses in computer networks and applied machine learning, business analytics, big data and worked on four team projects covering data science, network design, and business analytics.

EXPERIENCE

Cyber Security Intern — SkillDzire

Jun 2024

- Completed a two-week short-term internship in cyber security, organized by SkillDzire in collaboration with the Andhra Pradesh State Council of Higher Education (APSCHE), AICTE-approved.

SKILLS

Programming: Python (fundamentals — loops, functions, OOP), SQL

AI-Assisted Development: Direct AI coding tools to build machine learning pipelines, web applications, and prototypes — scoping the problem, writing prompts, and testing and debugging the output

Networking: CCNA Fundamentals

Concepts & Tools: feature engineering, model evaluation (R^2 , accuracy), hash-chain/blockchain design, Tableau, Git

Other: Report writing, Event coordination

PROJECTS

Big-Data Demand Forecasting

Team Project, INTI International University

- Trained Random Forest and Linear Regression models on over a million rows of demand data using pandas and scikit-learn, with lag, rolling average, and calendar features built from scratch.
- Linear Regression scored 0.9995 R^2 and trained in about 3 seconds, ahead of the Random Forest model at 0.90.

Abalone Age Prediction

Team Project, INTI International University

- Built a PyTorch neural network to predict abalone age from physical measurements. It reached 85% accuracy, ahead of the Linear Regression and Random Forest models we tested alongside it.

AgriChain

Academic Project, Karpagam Institution

- Built a blockchain-based supply chain tracker for agriculture. Every transaction is written into a SHA-256 hash chain, so tampering with a past record breaks the chain and can be caught.
- Built the React front end so growers, distributors, and buyers can trace a product from farm to sale.

TicketSwap India

Personal Project

- Designed and built a marketplace where people who can no longer use their event tickets can resell them to someone who missed out, so both sides benefit instead of the ticket going to waste. Built the prototype myself using Lovable.

Campus Network Design (CIS3201)

Team Project, INTI International University

- Designed the architecture for a simulated campus network using a three-tier layout (core, distribution, access) with VLAN segmentation and redundant links.

AdNova — Social Media Marketing Strategy

Team Project, INTI International University

- Put together the campaign dataset and built Tableau dashboards comparing engagement and cost across five social platforms.

STRENGTHS

Adaptability: Completed a semester abroad at INTI International University, adjusting to a new curriculum and country within weeks.

Teamwork: Worked on four group projects across data science, networking, and business analytics with a different teams.

Self-Direction: Designed and built TicketSwap India on my own, from the idea through to a working prototype.
